## *Bayesian Linear Regression*

# Maximum likelihood estimation

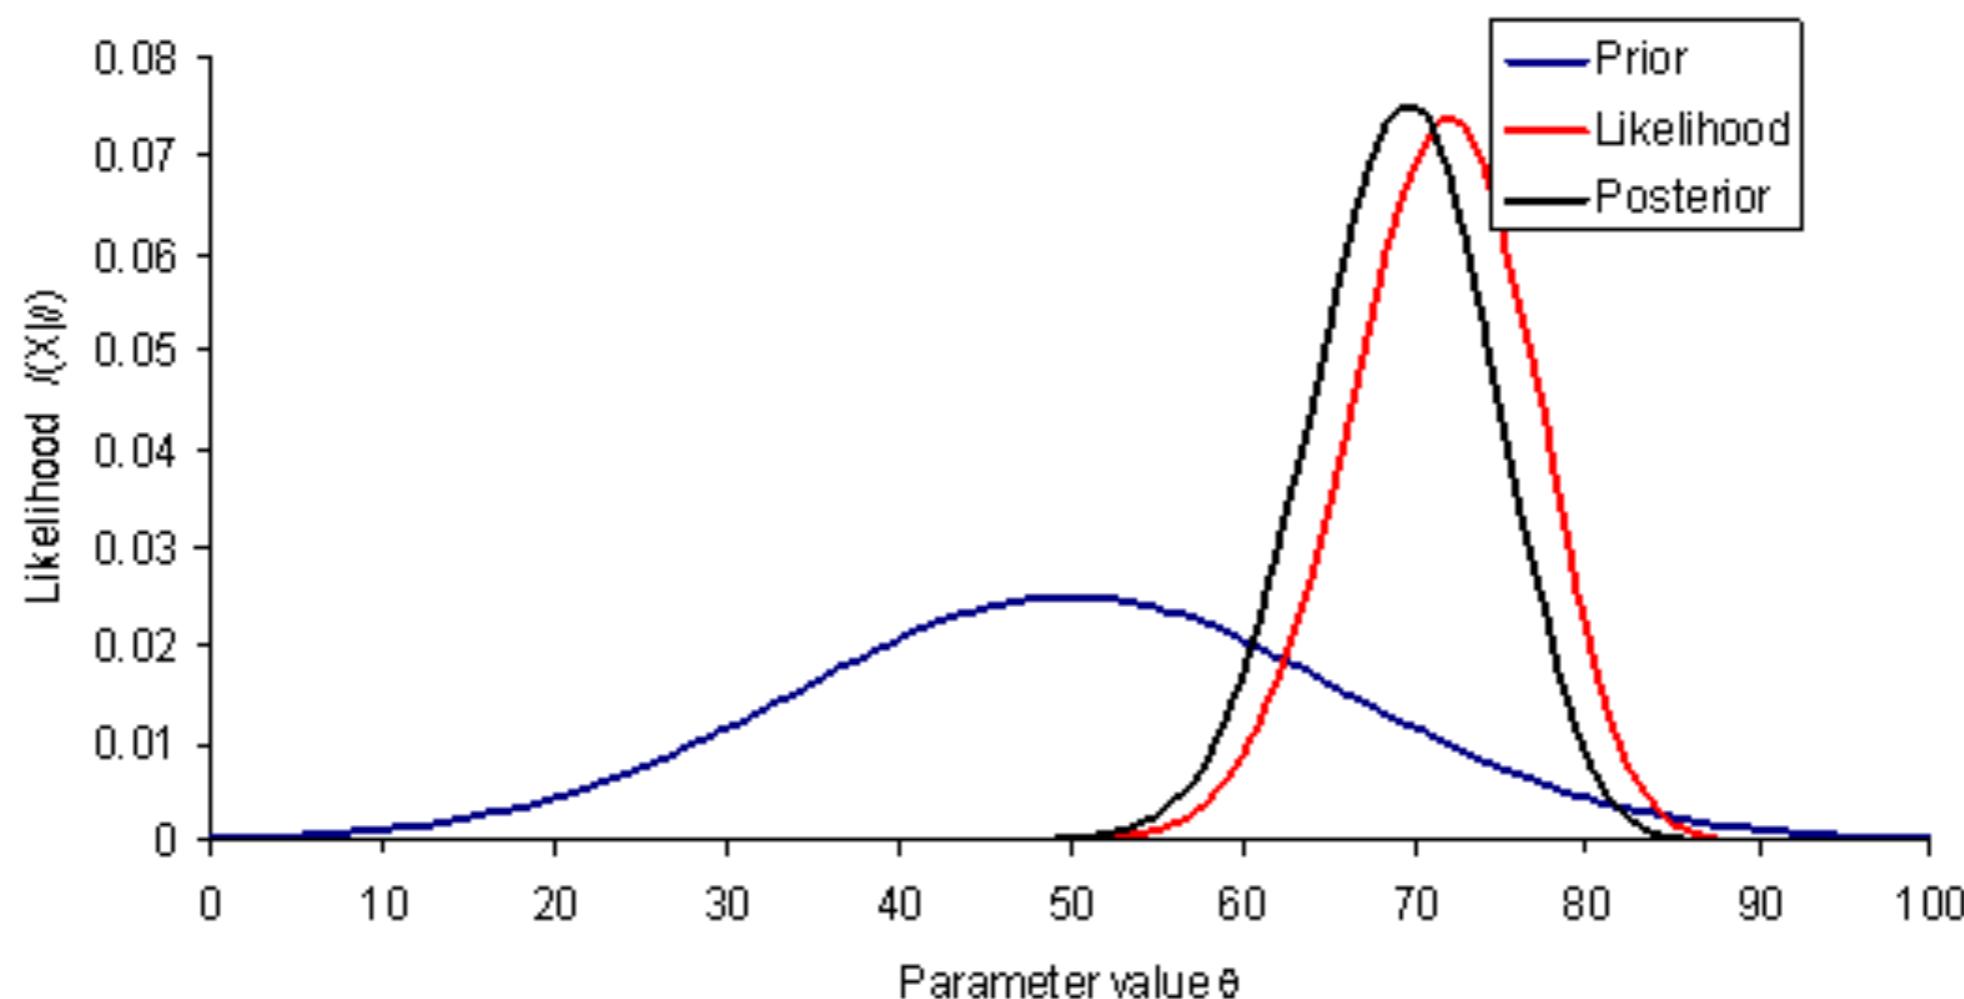

$$\theta_{\text{MLE}} = \arg \max_{\theta \in \Theta} p(\mathcal{D}|\theta)$$

Maximum Likelihood Estimation

# Bayesian estimation

$$p(\theta|\mathcal{D}) = \frac{p(\mathcal{D}|\theta)p(\theta)}{p(\mathcal{D})}$$

$$f:\mathcal{X}\rightarrow\mathcal{Y}$$

# Supervised learning

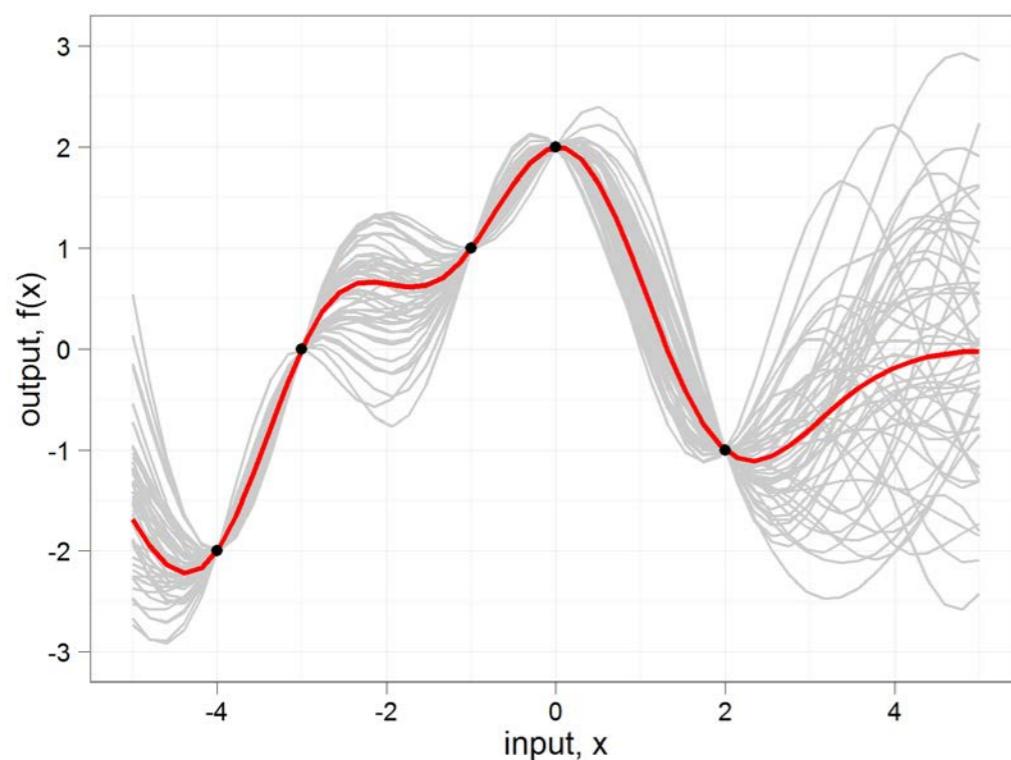

$$f : \mathcal{X} \rightarrow \mathcal{Y}$$

$$\mathcal{D} = \{\mathbf{x}, \mathbf{y}\}, \mathbf{x} \in \mathcal{X}, \mathbf{y} \in \mathcal{Y}$$

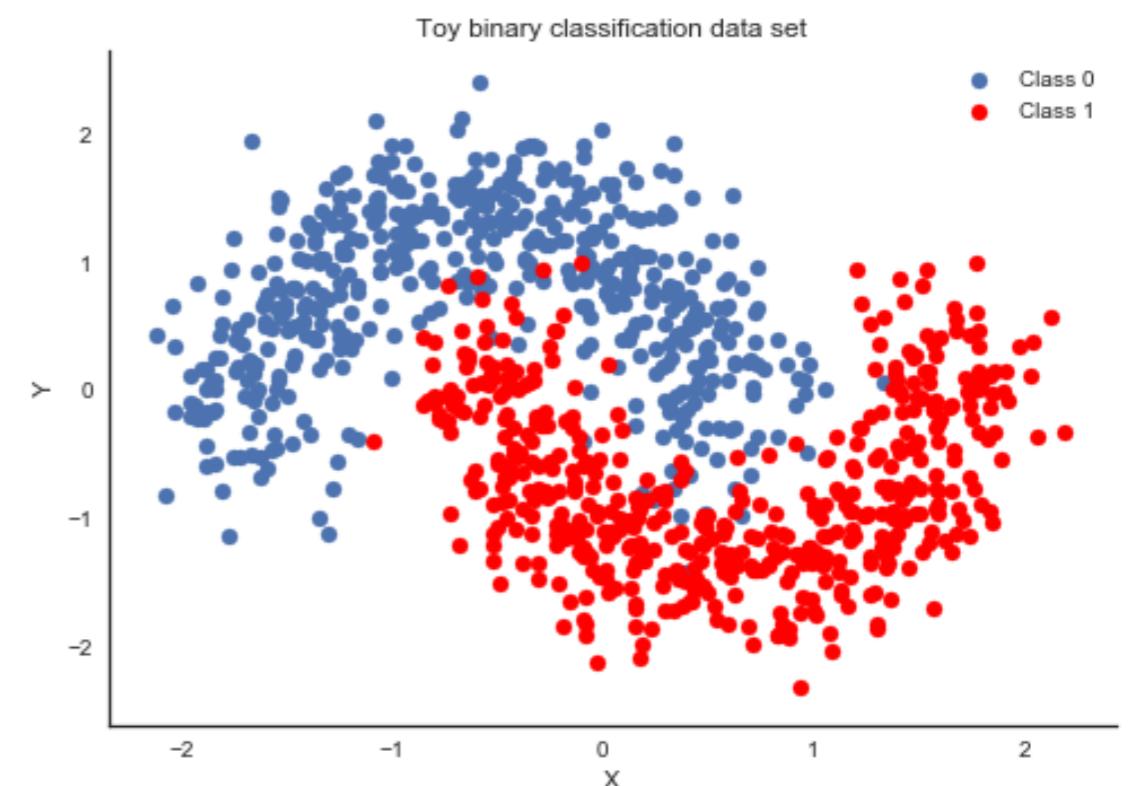

$$\mathbf{y} = f(\mathbf{x}) + \epsilon$$

$$p(f(\mathbf{x}^*) | \mathbf{x}^*, \mathcal{D})$$

Regression

Classification

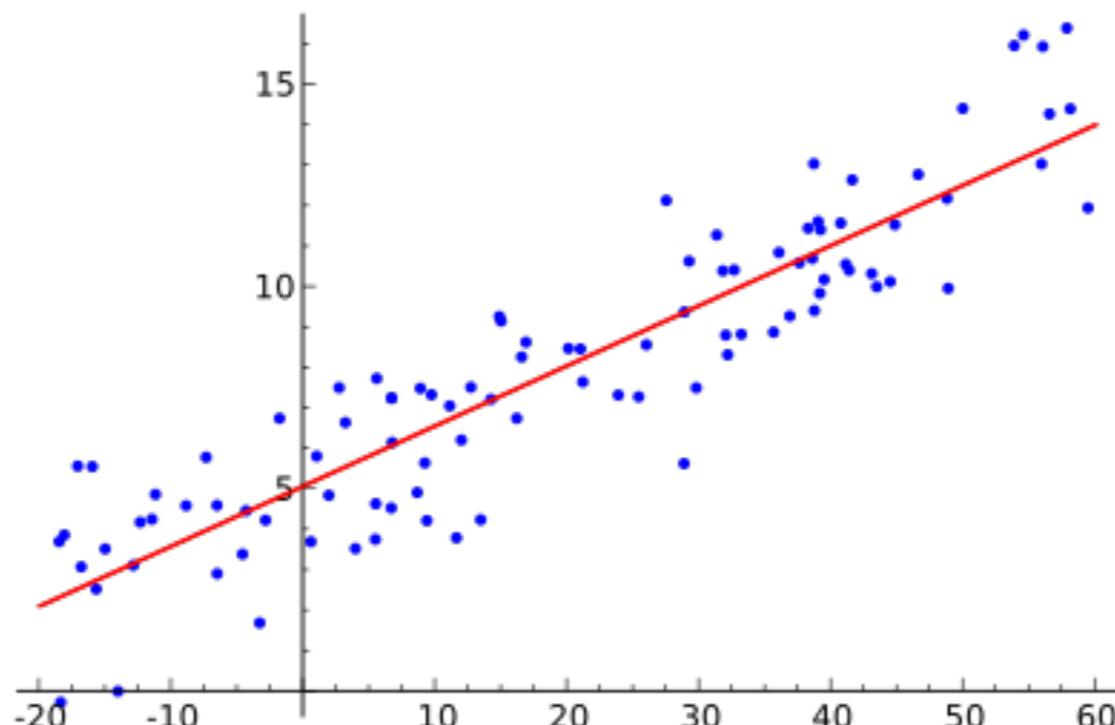

# Linear regression

$$f : \mathcal{X} \rightarrow \mathcal{Y}$$

$$\mathcal{D} = \{\mathbf{x}, \mathbf{y}\}, \mathbf{x} \in \mathcal{X}, \mathbf{y} \in \mathcal{Y}$$

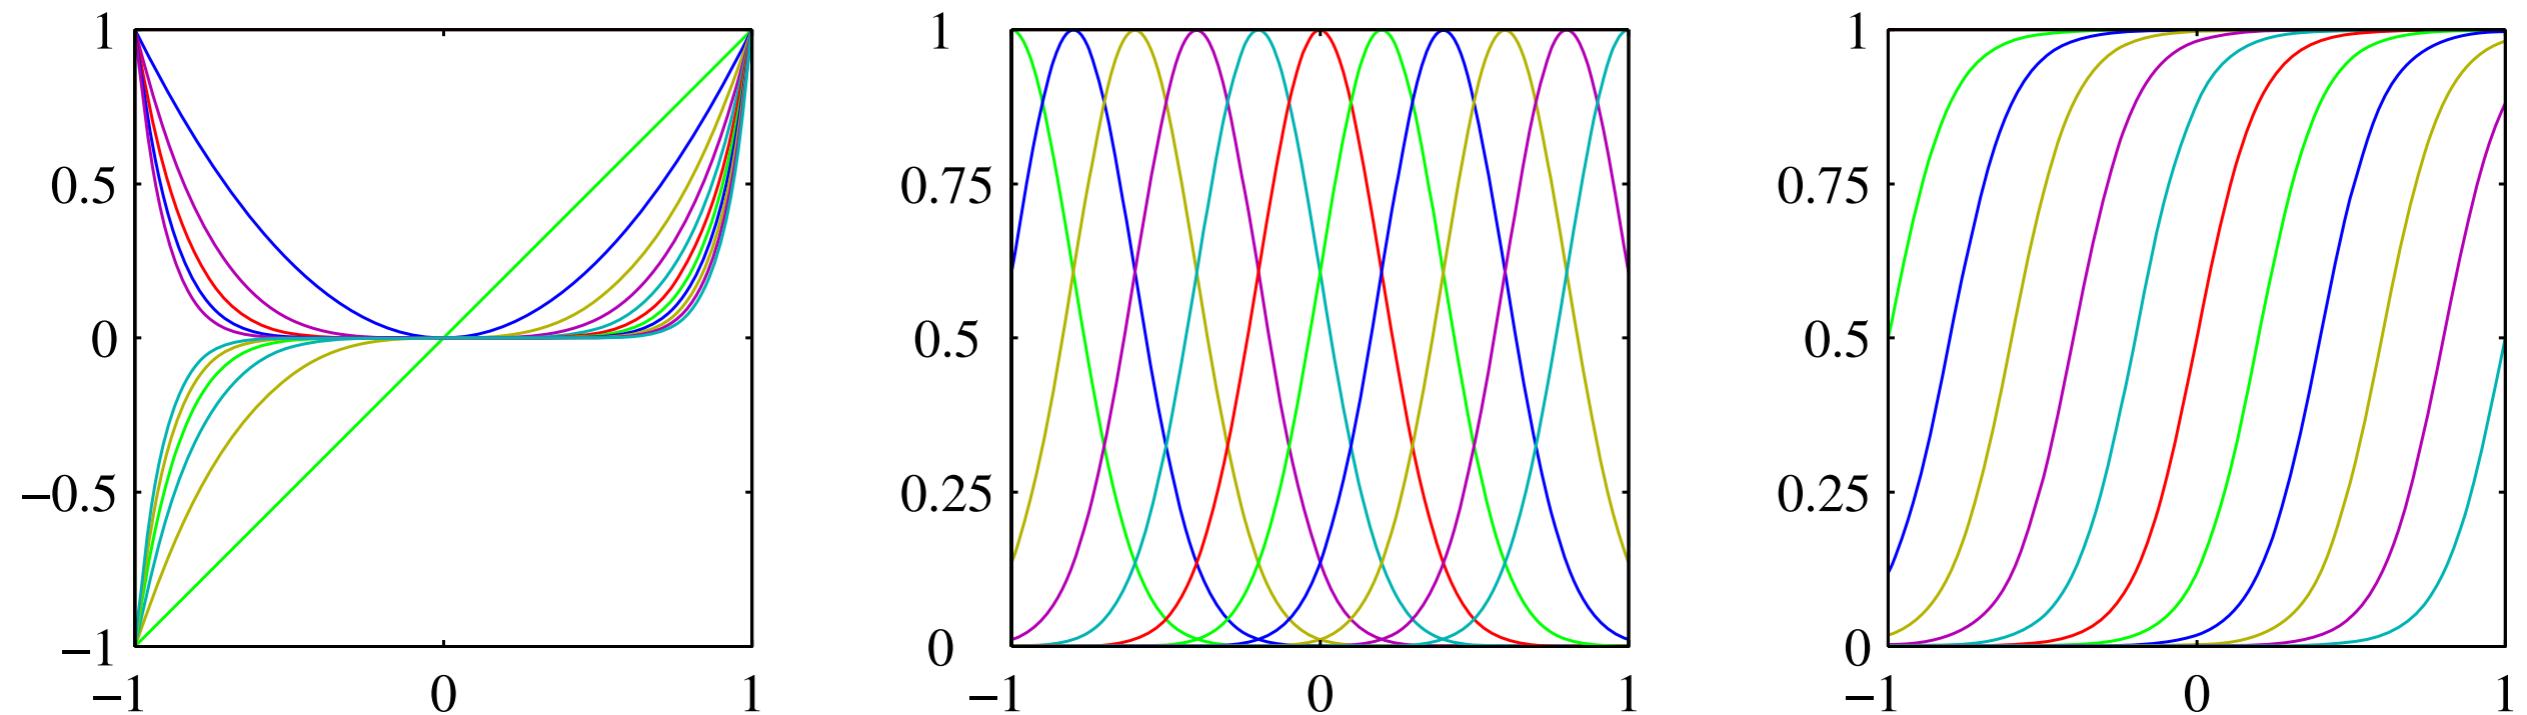

$$\mathbf{y} = f(\mathbf{x}) + \epsilon$$

$$f(\mathbf{x}) = \mathbf{w}^T \mathbf{x}$$

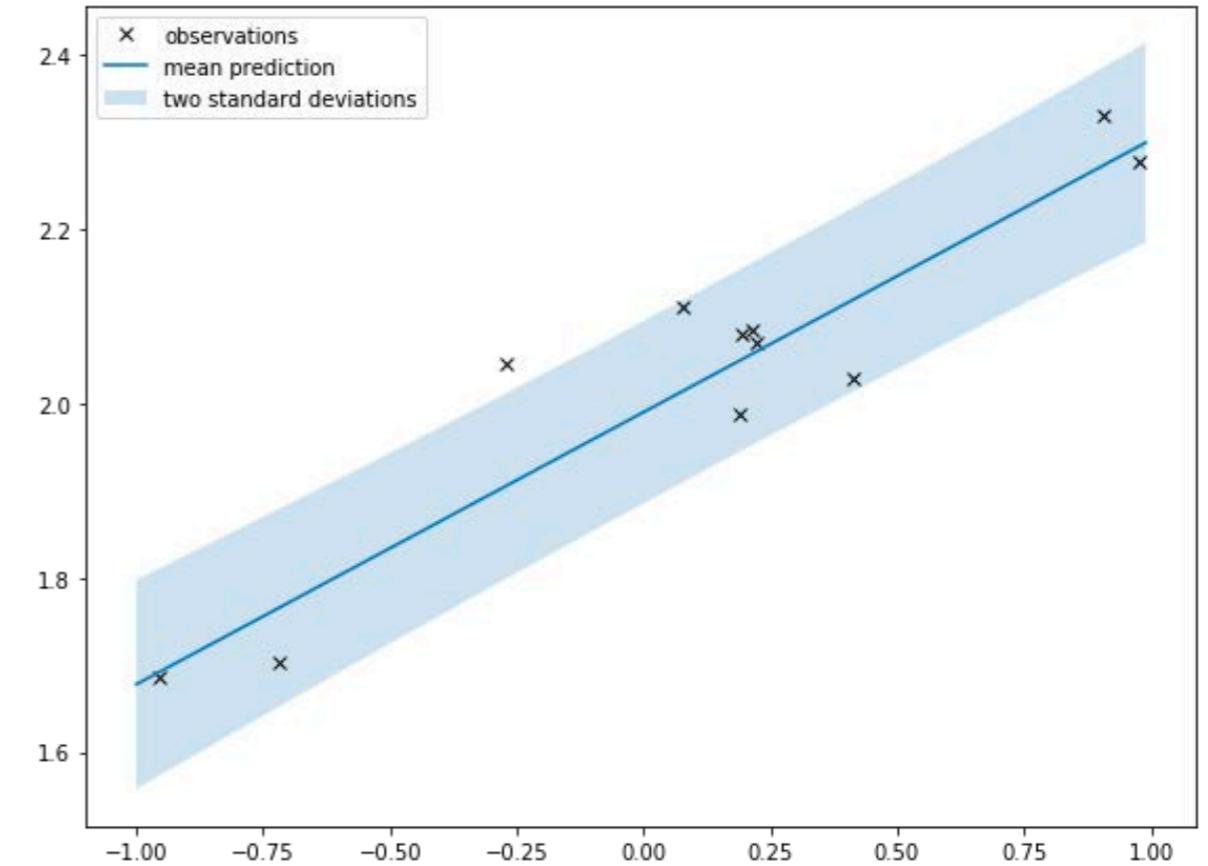

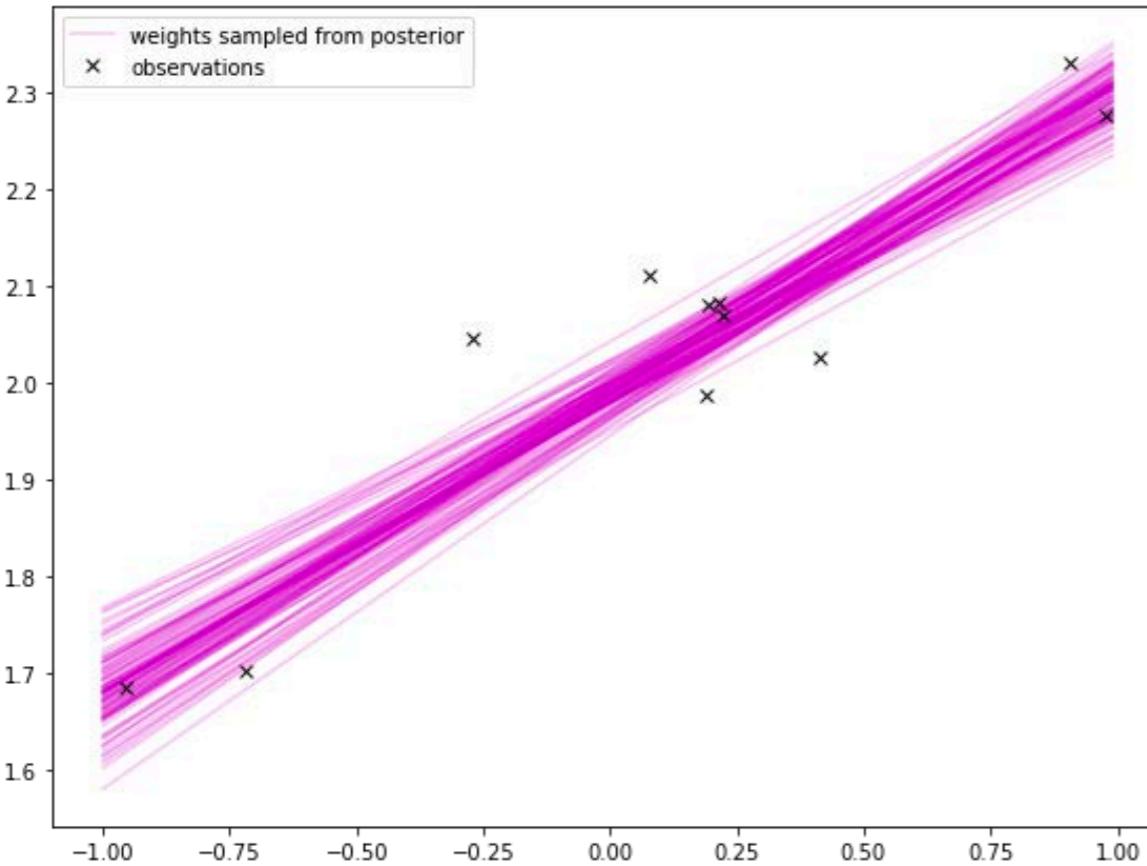

“It’s not just about lines and planes!”

# Linear regression with basis functions

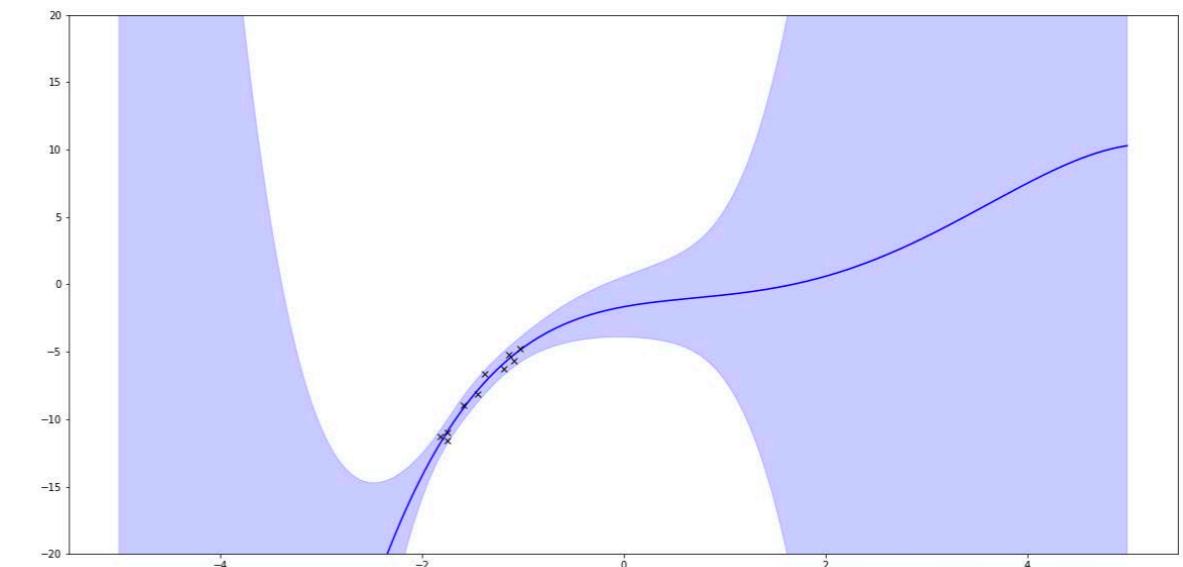

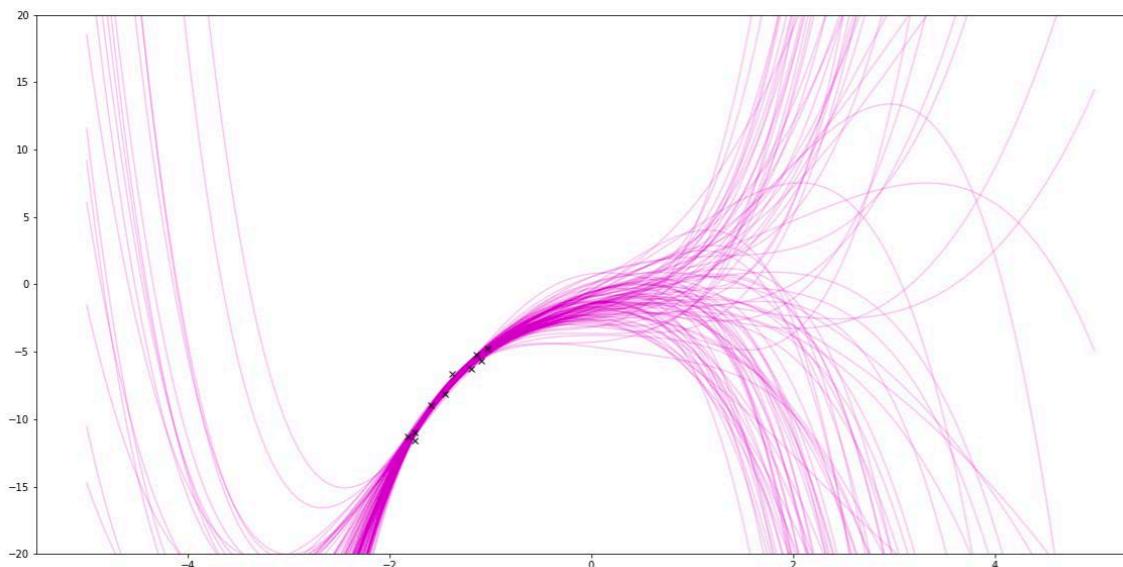

**Figure 3.1** Examples of basis functions, showing polynomials on the left, Gaussians of the form (3.4) in the centre, and sigmoidal of the form (3.5) on the right.

# Bayesian linear regression with basis functions

Nonlinear functions can be approximating using basis functions (or features)

$$y = w^T \phi(x) + \epsilon$$

# Geometrical interpretation

**Figure 3.2** Geometrical interpretation of the least-squares solution, in an  $N$ -dimensional space whose axes are the values of  $t_1, \dots, t_N$ . The least-squares regression function is obtained by finding the orthogonal projection of the data vector  $\mathbf{t}$  onto the subspace spanned by the basis functions  $\phi_j(\mathbf{x})$  in which each basis function is viewed as a vector  $\varphi_j$  of length  $N$  with elements  $\phi_j(\mathbf{x}_n)$ .
